Environment: Minecraft Java Edition Snapshot 13w06a in a single-player world. Use Creative mode as a practical way to obtain cobblestone and eggs; the report itself does not require a particular game mode. Keep the enclosure's chunk loaded and the single-player game unpaused while the chickens age.

PRECONDITIONS

- Configure the launcher to run the exact affected version Snapshot 13w06a, not a later release or either listed fix version.
- Use a world where a small level construction area is available and remains loaded for the entire test.
- Use solid cobblestone for the enclosure. Do not substitute transparent or partial barriers such as glass or fences, because the report describes those as a separate pass-through variant.
- Have enough inventory space for Cobblestone and Egg items.
- Use the default interaction control, right-click, to place blocks and throw eggs unless controls have been rebound.
- Once four chicks are present, do not pause the single-player game, leave the area, unload the chunk, replace blocks, push the chickens manually, or add more chickens.

STEPS TO REPRODUCE

1 **REPORT**

In the Minecraft Launcher, configure and start the exact historical Java Edition version listed as the first affected version: Snapshot 13w06a.

INPUT Snapshot 13w06a

SUCCESS CUE Minecraft reaches the title screen and identifies the running version as 13w06a.

2 **INFERRED**

Open Singleplayer and create a fresh world in Creative mode. Creative mode is selected only to make acquiring the required blocks and eggs deterministic; no cheats or commands are needed.

INPUT Singleplayer -> Create New World -> Game Mode: Creative -> Create New World

SUCCESS CUE The player has spawned in a Creative single-player world and can place blocks without collecting resources.

3 **INFERRED**

Move to a clear, level area with enough room to build and view a small enclosure. Wait until nearby terrain has rendered and movement responds normally before building.

INPUT W/A/S/D as needed

SUCCESS CUE The player is standing beside a loaded, level construction area with no existing blocks obstructing the enclosure.

4 **INFERRED**

Open the Creative inventory with the inventory control, whose default key is E. Locate Cobblestone and place a stack into one of the nine hotbar slots at the bottom of the screen.

INPUT E

SUCCESS CUE A Cobblestone stack is visible in the hotbar.

5 **INFERRED**

Close the inventory and select the hotbar slot containing Cobblestone, using its number key or the mouse wheel.

INPUT Hotbar number key 1-9 corresponding to Cobblestone

SUCCESS CUE Cobblestone is shown in the player's hand and its hotbar slot is highlighted.

6 **INFERRED**

Place one cobblestone block to serve as the floor of the enclosure. Keep track of this block as the single interior floor position.

INPUT Right-click

SUCCESS CUE One cobblestone floor block is present at the chosen test position.

7 **REPORT**

Around the four horizontal sides of the floor position, build solid cobblestone walls. Each side wall must extend two blocks vertically above the floor surface. Leave the central 1-by-1 air column empty and leave the top open so eggs can be thrown into it.

INPUT Right-click to place each Cobblestone block

SUCCESS CUE The construction has a one-block-wide interior, two blocks of interior height, four solid cobblestone sides, a solid floor, and an open top.

8 **REPORT**

Inspect the enclosure from above and from each accessible side. Confirm there are no gaps in the four walls and that every wall block is full cobblestone rather than glass, fence, slab, or another non-solid substitute.

SUCCESS CUE The only exit from the 1-by-1 interior is through the open top, and all four side walls are solid cobblestone and two blocks high.

9 **INFERRED**

Open the Creative inventory again. Locate the item named Egg and place a stack into a hotbar slot.

INPUT E

SUCCESS CUE An Egg stack is visible in the hotbar while the cobblestone enclosure remains intact.

10 **INFERRED**

Close the inventory and select the hotbar slot containing the eggs.

INPUT Hotbar number key 1–9 corresponding to Egg

SUCCESS CUE An egg is shown in the player's hand and the Egg hotbar slot is highlighted.

11 **INFERRED**

Stand beside or above the enclosure and aim the crosshair downward at the cobblestone floor inside the central 1-by-1 space. Do not enter or alter the enclosure.

SUCCESS CUE The crosshair points into the enclosure so a thrown egg will impact inside it rather than outside it.

12 **REPORT**

Throw one egg into the enclosure with the use-item control, whose default input is right-click. Wait for that egg to impact before throwing another.

INPUT Right-click once

SUCCESS CUE The egg has broken inside the enclosure; either no chick appeared or one or more baby chickens are visibly confined inside.

13 **REPORT**

Count the baby chickens currently inside after each impact. If fewer than four are present, repeat steps 11 and 12 one egg at a time. Stop throwing eggs as soon as exactly four baby chickens are simultaneously present. Because egg hatching is random, many eggs may be required. If a rare multi-chick hatch causes the total to jump above four, discard that attempt and repeat in a fresh enclosure so the aging phase begins with exactly four.

INPUT Right-click once per egg

SUCCESS CUE Exactly four small, baby-sized chickens are visible inside the enclosure, and no adult chicken is present.

14 **INFERRED**

Select an empty hotbar slot or a non-egg item so no additional eggs are thrown accidentally. Move to a viewing position immediately outside the enclosure where all four chicks can be monitored without touching or pushing them.

INPUT Select an empty hotbar slot; W/A/S/D as needed

SUCCESS CUE Exactly four baby chickens remain confined in the 1-by-1 enclosure, and the player can see them without holding an egg.

15 **REPORT** **TRIGGER**

Allow the four chickens to age naturally. Keep the game running, remain close enough that the enclosure stays loaded, and do not open the pause menu. Watch continuously until the first chick visibly changes from the smaller baby form to the full-size adult form. The growth transition while confined next to the solid cobblestone walls is the trigger action for observation.

SUCCESS CUE At least one of the original four egg-spawned chickens has just completed its visible baby-to-adult size transition while the enclosure remains unchanged and loaded.

HANDOFF TO OBSERVATION

The first of the four egg-spawned chicks has just changed to adult size inside the unchanged 1-by-1, two-block-high solid cobblestone enclosure. Keep the world unpaused and the chunk loaded, make no further player interactions with the chickens or enclosure, and hand control to the observation subsystem for the remainder of the chickens' maturation and the report's final count.

UNCERTAINTIES

- The report does not specify a game mode. Creative mode is selected as a practical implementation choice for obtaining cobblestone and enough eggs without adding unrelated resource gathering.
- The phrase "one block large, two block high enclosure" is interpreted as a 1-by-1 interior floor space surrounded on all four sides by full solid walls extending two blocks above the floor, with the top left open for throwing eggs.
- Chicken hatching from thrown eggs is random. The plan therefore uses repeated single throws and requires a fresh attempt if a multi-chick hatch causes the initial population to exceed four.
- The report provides no exact natural-growth duration. The plan uses the visible baby-to-adult model transition as the readiness and trigger cue rather than assuming a timer.
- The report lists 21w05a both among affected versions and among fix versions. This plan preserves the affected-version list exactly as supplied and recommends the first listed affected version, Snapshot 13w06a, without evaluating fix status.
