

Client continues to connect to server after canceling on 'Connecting to server' screen

MC-74984 NETWORKING

Status	Resolved / Fixed
Affected	Minecraft 1.8; Minecraft 1.8.1; Minecraft 1.8.3; Minecraft 1.8.4; Minecraft 1.8.7; Minecraft 1.8.8; Minecraft 1.8.9; Minecraft 1.9.1; Minecraft 1.9.2; Minecraft 1.9.4; Minecraft 1.10; Minecraft 1.11.2; Minecraft 17w16b; Minecraft 1.12; Minecraft 1.12.2; Minecraft 1.13; Minecraft 18w31a (+more)
Fixed in	1.20 Pre-release 5
Reported	2014-12-01
Mojira category	Networking

REPRODUCTION TARGET

Use version: Minecraft 1.8

Affected versions (30):

Minecraft 1.8

Minecraft 1.8.1

Minecraft 1.8.3

Minecraft 1.8.4

Minecraft 1.8.7

Minecraft 1.8.8

Minecraft 1.8.9

Minecraft 1.9.1

Minecraft 1.9.2

Minecraft 1.9.4

Minecraft 1.10

Minecraft 1.11.2

Minecraft 17w16b

Minecraft 1.12

Minecraft 1.12.2

Minecraft 1.13

Minecraft 18w31a

Minecraft 1.13.1

1.14.4

1.15.2

20w13b

1.16 Pre-release 5

1.16.1

1.16.2

1.16.3

1.16.4

20w51a

1.16.5 Release Candidate 1

1.16.5

1.19

Environment:

Use an unmodified Minecraft Java Edition 1.8 client in a fresh game session. Provide two distinct, simultaneously reachable multiplayer server endpoints, Server A and Server B, which both accept connections from the same 1.8 test account. Prefer controlled vanilla-compatible test servers rather than public servers. Server A's connection establishment must be slow enough that the client remains on the 'Connecting to server' screen long enough to press its Cancel button; the report suggests inducing this with delayed DNS/IP lookup through a proxy. Server B should connect normally. Do not use the listed fix version, 1.20 Pre-release 5.

PRECONDITIONS

- A valid Minecraft account is available and can use multiplayer in Minecraft Java Edition 1.8.
- Two different server addresses are available: <SERVER_A_ADDRESS> and <SERVER_B_ADDRESS>. They must lead to separate servers, not aliases for the same server.
- Both servers are running, accept the Minecraft 1.8 client protocol, and permit the same test account to join.
- The executor is authorized to test against both servers. Controlled test servers are strongly preferred because the report describes connection-state and item-transfer side effects.
- Server A is configured, directly or through a test proxy/DNS mechanism, so connection establishment remains incomplete long enough for the client to display and accept the Cancel button. Server B is not subject to that delay.
- The Minecraft client has been completely closed before beginning, so no connection left over from an earlier test can affect this reproduction.
- The affected version selected in the launcher is exactly Minecraft 1.8, the first entry in the report's affected-version list.

STEPS TO REPRODUCE

1 INFERRED

Start or verify both multiplayer servers. Wait until each server has completed startup and is ready to accept connections. Use the server consoles or another out-of-band readiness check; do not join either server from the test client yet.

SUCCESS CUE Server A and Server B are both online under different addresses and are ready to accept the Minecraft 1.8 test account.

2 REPORT

Apply a connection-establishment delay to Server A. Use the test environment's proxy or DNS controls to delay Server A's DNS lookup or connection sufficiently for the Minecraft client to remain on the connection screen. Do not delay Server B. The report does not prescribe a specific proxy product or configuration.

INPUT <SERVER_A_ADDRESS>

SUCCESS CUE Server A remains reachable but is expected to leave enough time to click Cancel before world loading completes; Server B remains normally reachable.

3 REPORT

In the Minecraft Launcher, select the installation/profile for exactly Minecraft 1.8 and start the game. Do not select 1.20 Pre-release 5, which is listed as a fix version.

INPUT Minecraft 1.8

SUCCESS CUE The Minecraft 1.8 main menu is displayed in a newly started client session.

4 INFERRED

From the main menu, left-click Multiplayer.

INPUT Multiplayer

SUCCESS CUE The Play Multiplayer server-list screen is open.

5 INFERRED

If Server A is not already present, left-click Add server, enter a recognizable name such as Server A and enter <SERVER_A_ADDRESS> in the Server Address field, then left-click Done. If it is already present with the correct address, leave it unchanged.

INPUT Server Name: Server A; Server Address: <SERVER_A_ADDRESS>

SUCCESS CUE A server-list entry labeled Server A is visible and points to <SERVER_A_ADDRESS>.

6 INFERRED

If Server B is not already present, left-click Add server, enter a recognizable name such as Server B and enter <SERVER_B_ADDRESS> in the Server Address field, then left-click Done. If it is already present with the correct address, leave it unchanged.

INPUT Server Name: Server B; Server Address: <SERVER_B_ADDRESS>

SUCCESS CUE Separate Server A and Server B entries are visible in the multiplayer server list.

7 **REPORT**

Select the Server A entry and begin connecting by left-clicking Join Server. Double-clicking the Server A entry is also acceptable, but issue only one join action.

INPUT Select Server A; left-click Join Server

SUCCESS CUE The server list is replaced by a connection-progress screen for Server A.

8 **REPORT**

Wait only until the connection-progress screen displays 'Connecting to server' and presents an enabled Cancel button. Do not wait for Server A's terrain, HUD, or in-world play screen to appear.

SUCCESS CUE The client is still connecting to Server A, the in-world play screen has not loaded, and the Cancel button is available.

9 **REPORT** **TRIGGER**

While the client is still on the Server A connection-progress screen, immediately left-click Cancel once. Do not allow Server A to finish loading before this input.

INPUT Cancel

SUCCESS CUE The connection-progress screen closes and the client returns to either the multiplayer server list or the main menu.

10 **INFERRED**

Proceed back to the multiplayer server list without intentionally waiting. If cancellation returned directly to the server list, perform no navigation action. If it returned to the main menu, immediately left-click Multiplayer.

INPUT Multiplayer, only if the main menu is displayed

SUCCESS CUE The multiplayer server list containing Server A and Server B is displayed again, with no client restart or deliberate delay since Cancel was pressed.

11 **REPORT**

As soon as the server list is usable, select Server B and begin connecting by left-clicking Join Server. Do not reconnect to Server A, restart the client, or enter another world between the cancellation and this action.

INPUT Select Server B; left-click Join Server

SUCCESS CUE The server list is replaced by the connection-progress screen for Server B.

12 **REPORT**

Allow the Server B connection to complete. Wait until the client transitions to an in-world play screen and enough initial terrain has rendered to identify that Server B was entered. Do not disconnect, return to the menu, or restart the game after reaching this state.

SUCCESS CUE An in-world play screen reached through Server B is displayed after the canceled Server A attempt, and the client session remains open for immediate observation.

HANDOFF TO OBSERVATION

The client has just completed entry into Server B in the same uninterrupted Minecraft 1.8 session in which Server A was canceled at the 'Connecting to server' screen. The in-world play screen is visible. Do not disconnect, reconnect, change worlds, or restart the client; hand control to the observation subsystem now.

UNCERTAINTIES

- The report does not provide the addresses or configurations of the two original servers. <SERVER_A_ADDRESS> and <SERVER_B_ADDRESS> must be supplied by the test environment.
- The reproduction is timing-sensitive. The report does not state an exact maximum interval between pressing Cancel and starting the Server B connection; perform the second connection as soon as the interface permits and introduce no intentional pause.
- The report suggests increasing Server A's DNS/IP lookup time with a proxy that forces DNS lookups, but it does not name a proxy product or provide exact proxy configuration commands.
- The original description used CubeKrowd as Server A and an unnamed second server. This plan substitutes authorized controlled servers because later report comments state that the issue was confirmed on vanilla and could be reproduced with other servers.
- A separate F5/ESC reproduction variant in the comments was specifically documented for Minecraft 1.8.7. It is not used here because the required recommended version is Minecraft 1.8, the first affected version listed in the report.
- If Server A connects too quickly for the Cancel input to occur before world loading, that attempt does not satisfy the report's timing precondition. Increase the Server A lookup/connection delay, completely restart the client to clear the session, and begin again.
