1.16.4 Pre-release 2

1.16.4 Release Candidate 1

1.16.4

20w45a

20w46a

Environment:

Minecraft Java Edition 1.4.4 in single-player on the integrated server, using a fresh Superflat world in Creative mode with cheats enabled. Perform two independent executions of this plan: a lava run using the Lava Bucket and ``/tp ~ 62.39 ~``, and a water run using the Water Bucket and ``/tp ~ 63.39 ~``. Use a fresh world for each run so that the fluids cannot interact.

PRECONDITIONS

- A launcher installation for the exact historical version Minecraft 1.4.4 is available and can start successfully.
- Default movement and interaction controls are assumed: E opens the inventory, T opens chat, Space controls upward movement and toggles Creative flight when double-tapped, left-click breaks a block, and right-click uses or places the selected item.
- The test must be performed in Creative mode, and cheats must be enabled so the report's `/tp`` command can be executed.
- Choose one run before beginning: the lava run or the water run. Complete the setup and hand off for that run, then create another fresh world and repeat for the other fluid.
- The player must not have a resource pack, mod, shader, or third-party client installed unless separately required by the reproduction system; none is specified by the report.
- Because `/setblock`` is unavailable in Minecraft 1.4.4, the source block must be positioned manually with the matching filled bucket. The report's exact source-placement commands are preserved in uncertainties and must not be entered in 1.4.4.

STEPS TO REPRODUCE

1 REPORT

Start the Minecraft launcher, select an installation that runs the exact version Minecraft 1.4.4, and launch the game without mods.

INPUT Minecraft 1.4.4

SUCCESS CUE The Minecraft 1.4.4 title screen is displayed.

2 INFERRED

Open Singleplayer and create a fresh test world. Set Game Mode to Creative. Open More World Options, set World Type to Superflat, set Allow Cheats to ON, return to the main world-creation screen, and create the world. Do not reuse the same world for the lava and water runs.

INPUT

Singleplayer -> Create New World -> Game Mode: Creative -> More World Options -> World Type: Superflat -> Allow Cheats: ON -> Done -> Create New World

SUCCESS CUE A fresh Superflat world has loaded and the player is in Creative mode.

3 INFERRED

Wait before building until the terrain around the player has rendered and movement responds normally.

SUCCESS CUE The nearby Superflat terrain is visible, no loading screen is present, and movement inputs respond immediately.

4 REPORT

Start Creative flight by quickly pressing the jump control twice. Use Space to rise several blocks and then release all movement controls so the player hovers.

INPUT Double-tap Space

SUCCESS CUE The player remains suspended in the air instead of falling to the ground.

5 INFERRED

Press E to open the Creative inventory. Put one nonflammable solid building block, such as Stone, in a hotbar slot. For the lava run, also put a Lava Bucket in another hotbar slot. For the water run, instead put a Water Bucket in another hotbar slot. The hotbar is the row of nine slots at the bottom of the inventory and gameplay screen.

INPUT E; obtain Stone and either Lava Bucket or Water Bucket

SUCCESS CUE Stone and exactly the filled bucket selected for this run are visible in separate hotbar slots.

6 INFERRED

Close the inventory with E. Press F3 to display debug information and choose an integer horizontal target column near the player, denoted (T_x , T_z). The fluid source will occupy block coordinates (T_x , 64, T_z). Ensure this location and the immediately surrounding blocks at $Y=64$ are open air. Record T_x and T_z for use during alignment.

INPUT E, then F3

SUCCESS CUE The debug overlay is visible, T_x and T_z have been recorded, and the intended block at (T_x , 64, T_z) is open air.

7 **INFERRED**

Using Stone, construct a temporary one-block-wide support pillar in the adjacent column (T_x+1 , T_z). Build upward from the Superflat ground until the top Stone block occupies $Y=64$. Use Creative flight and the F3 coordinates to control the height; do not place a solid block in the target fluid column (T_x , T_z).

INPUT Select Stone; right-click repeatedly to place the temporary pillar

SUCCESS CUE A Stone support block occupies (T_x+1 , 64, T_z), while (T_x , 64, T_z) remains open air.

8 **INFERRED**

Select the filled bucket in the hotbar by pressing its hotbar number or scrolling to it. Confirm that the bucket name corresponds to the chosen run.

INPUT Select Lava Bucket for the lava run, or Water Bucket for the water run

SUCCESS CUE The matching filled bucket is held in the player's hand and its hotbar slot is highlighted.

9 **INFERRED**

Aim at the side face of the $Y=64$ support block that borders the target air block (T_x , 64, T_z). Right-click once with the filled bucket to place one source block in the target column. Do not place the fluid on top of the support block.

INPUT Right-click once with the selected filled bucket

SUCCESS CUE The selected fluid occupies block (T_x , 64, T_z).

10 **INFERRED**

Switch to an empty hand or another item. In Creative mode, left-click the temporary support blocks at (T_x+1 , 64, T_z), (T_x+1 , 63, T_z), and (T_x+1 , 62, T_z) to remove them. Do not left-click the fluid source block.

INPUT Left-click each of the three specified support blocks once

SUCCESS CUE No solid support block remains beside the fluid at $Y=62$ through $Y=64$, and the source fluid is still present at (T_x , 64, T_z).

11 **INFERRED**

Wait briefly for fluid and block updates to process. Remain in flight and do not enter the source yet.

SUCCESS CUE The source block remains in the target column, nearby fluid movement has updated, and player controls remain responsive.

12 **INFERRED**

While flying above $Y=65$, move horizontally over the source. Use the F3 coordinates to place the player's X coordinate within T_x through T_x+1 and Z coordinate within T_z through T_z+1 , preferably near the center of the source column. Release all horizontal movement controls once aligned.

INPUT W/A/S/D as needed; release all movement keys after alignment

SUCCESS CUE The player is hovering above the source with both horizontal coordinates inside the source block's column.

13 **REPORT**

Open chat by pressing T. For the lava run, enter the report's exact teleport command `/tp ~ 62.39 ~`. For the water run, enter the report's exact teleport command `/tp ~ 63.39 ~`. Include the leading slash and press Enter once. Do not add a player selector or alter the decimal value.

INPUT Lava run: /tp ~ 62.39 ~ Water run: /tp ~ 63.39 ~

SUCCESS CUE The command closes chat and moves the player vertically while preserving the aligned X and Z position.

14 **INFERRED**

If the debug overlay is not already visible, press F3. Confirm that the displayed player Y position is approximately 62.39 for the lava run or 63.39 for the water run, and confirm that X and Z are still inside the chosen source column. Then press F3 again to hide the overlay so it does not obstruct rendering observation.

INPUT F3 to verify, then F3 to hide

SUCCESS CUE The required decimal Y position has been confirmed, the player remains horizontally aligned with the fluid source, and the debug overlay is hidden.

15 **REPORT**

Release every movement, jump, and descend control. Do not change altitude or move horizontally during the camera test.

INPUT Release W, A, S, D, Space, and Left Shift

SUCCESS CUE The player remains stationary at the teleported position inside the selected fluid setup.

16 **REPORT** **TRIGGER**

Begin changing only the camera pitch: slowly move the mouse upward until looking steeply upward, then reverse and move it downward until looking steeply downward. Continue a slow up-and-down pitch sweep without moving the player or changing the horizontal viewing direction more than necessary.

INPUT Slow vertical mouse movement: look up, then look down

SUCCESS CUE The camera pitch is actively sweeping up and down while the player's position and altitude remain unchanged.

HANDOFF TO OBSERVATION

The player is stationary at the report-specified Y position, horizontally aligned with the manually placed Y=64 source block, the debug overlay is hidden, and the first slow up-and-down camera sweep has begun. Hand control to the observation subsystem during this sweep; after that run is complete, repeat the plan in a fresh world for the other fluid variant.

UNCERTAINTIES

- The report lists Minecraft 1.4.4 first, so it is the required recommended version. However, the supplied `/setblock` command did not exist in that version; external version history indicates `/setblock` was introduced in snapshot 13w37a for Java Edition 1.7.2. The plan therefore substitutes manual bucket placement only for the unavailable source-placement operation.
- The raw report's exact source-placement commands are `/setblock ~ 64 ~ lava` and `/setblock ~ 64 ~ water`. They are intentionally not executed in Minecraft 1.4.4 because they would be unrecognized. If a separate command-exact reproduction is requested, Minecraft 1.7.4 is the first formally listed affected version in this report that postdates the addition of `/setblock`; that does not change the required recommended_version.
- Manual bucket placement causes normal fluid updates around the source and may not be perfectly identical to placement by `/setblock`. The source block itself is positioned at the same Y=64 block coordinate required by the report, and nearby temporary solid blocks are removed before triggering the test.
- The report supplies no world seed, absolute X/Z coordinates, terrain requirement, or required world type. A fresh Superflat world and an arbitrary recorded target column are practical choices intended to remove terrain and exploration variability.
- The report does not specify the exact camera pitch or mouse speed at which the relevant rendering state becomes inspectable. The plan uses a slow sweep across the available upward and downward pitch range while keeping player position fixed.
- The lava and water procedures have different teleport heights and are treated as independent runs. Combining them in one location could create stone or cobblestone and invalidate the setup.
