

Villagers have insomnia

[MC-305691](#) VILLAGE SYSTEM

Status	Resolved / Fixed
Affected	26.1 Snapshot 3
Fixed in	26.1 Snapshot 4
Reported	2026-01-13
Mojira category	Mob behaviour; Village system

REPRODUCTION TARGET

Version: Minecraft: Java Edition 26.1 Snapshot 3 for the trigger phase; prepare the same world and its claimed bed in 26.1 Snapshot 2, the immediately preceding snapshot.

Environment: Single-player Minecraft: Java Edition using the integrated server. Use the official Minecraft Launcher with installations for 26.1 Snapshot 2 and 26.1 Snapshot 3. Use Creative mode, commands enabled, Peaceful difficulty, a Superflat Overworld with structures disabled, and no mods or datapacks. Both installations must use the same game directory, or the exact same world save must be copied from the Snapshot 2 saves directory to the Snapshot 3 saves directory.

PRECONDITIONS

- Install or create launcher installations for both Minecraft: Java Edition 26.1 Snapshot 2 and 26.1 Snapshot 3. Snapshot 3 is the affected version; do not use Snapshot 4 or a later version for the trigger phase.
- The original report's later clarification states that the bed must already exist before the world is opened in 26.1 Snapshot 3. This plan uses 26.1 Snapshot 2 as the deterministic source version because it immediately precedes Snapshot 3.
- Ensure both launcher installations can access the same world save. If custom game directories are used, copy the complete source-world folder rather than creating a new world in Snapshot 3.
- Back up the source world before opening it in Snapshot 3. Snapshot testing can damage or permanently convert worlds.
- Use a fresh test world without other villagers, beds, bells, job-site blocks, villages, mods, or datapacks so that another point of interest cannot interfere with bed claiming.
- Use Peaceful difficulty to prevent hostile mobs from attacking or distracting the villager during the nighttime test.
- Keep particle rendering enabled at the highest available setting so that the green particles used by the report as the bed-claim confirmation are visible.
- Do not break, move, replace, or add another bed after upgrading the world to Snapshot 3. Replacing the bed is explicitly described as restoring sleeping and would invalidate the intended trigger condition.

STEPS TO REPRODUCE

1 VERIFIED

Open the official Minecraft Launcher, select the Installations tab, enable visibility of snapshot versions if necessary, and create one installation for 26.1 Snapshot 2 and another for 26.1 Snapshot 3. Leave both on the same default game directory unless the world save will be copied manually between directories.

INPUT

```
Installations -> enable Snapshots -> New Installation -> Version: 26.1 Snapshot 2; repeat with Version: 26.1 Snapshot 3
```

SUCCESS CUE Two distinct Java Edition launcher installations are available: one labeled 26.1 Snapshot 2 and one labeled 26.1 Snapshot 3.

2 INFERRED

Launch the 26.1 Snapshot 2 installation. Wait for the title screen to finish loading and verify that the displayed game version is 26.1 Snapshot 2.

SUCCESS CUE The Minecraft: Java Edition title screen identifies the running version as 26.1 Snapshot 2.

3 INFERRED

Open Singleplayer and begin creating a new world. Give it a recognizable name so that the same save can be selected after switching versions.

INPUT

```
Singleplayer -> Create New World -> World Name: MC-305691-pre-snapshot-3
```

SUCCESS CUE The Create New World screen shows the world name MC-305691-pre-snapshot-3.

4 INFERRED

Configure the world for deterministic setup: select Creative mode, enable commands if that is exposed as a separate option, set difficulty to Peaceful, select the Superflat world type, and disable structure generation. Do not enable experiments, bonus chests, datapacks, or custom world generation.

INPUT

```
Game Mode: Creative; Allow Commands: On; Difficulty: Peaceful; World Type: Superflat; Generate Structures: Off
```

SUCCESS CUE The creation screen is configured for a Creative, command-enabled, Peaceful Superflat world without generated structures.

5 REPORT

Create the world and wait until the terrain has fully rendered and player movement responds normally.

INPUT

```
Create New World
```

SUCCESS CUE The player is standing on a flat Overworld surface in 26.1 Snapshot 2, nearby terrain is rendered, and movement is responsive.

6 INFERRED

Ensure the green bed-claim particles will be visible. Open the pause menu, navigate to the video settings, set Particles to All or the highest equivalent setting, and return to the world.

INPUT

```
Esc -> Options -> Video Settings -> Particles: All -> Done
```

SUCCESS CUE The world is active again with particle rendering set to All.

7 **INFERRED**

Set the world to daytime so the source-world setup can be completed without immediately beginning the nighttime sleep attempt. Press T to open in-game chat, enter the command with its leading slash, and press Enter.

INPUT `/time set day`

SUCCESS CUE Command feedback confirms that the time was set, and the Overworld is visibly in daytime.

8 **INFERRED**

Stand on an unobstructed area of the flat surface with several empty blocks around the player. Avoid building near any bed, villager, or village other than the ones created by this procedure.

SUCCESS CUE A clear, level test area is available with enough room for one villager to walk to one bed.

9 **INFERRED**

Summon one adult villager two blocks from the player. Press T to open chat, enter the command exactly with the leading slash, and press Enter.

INPUT `/summon minecraft:villager ~2 ~ ~`

SUCCESS CUE Exactly one adult villager is visible approximately two blocks from the player in the clear test area.

10 **INFERRED**

Obtain one bed from the Creative inventory. Press E to open the inventory, select the Search Items tab if necessary, search for bed, and place any one bed item into an empty hotbar slot. Close the inventory with E or Esc.

INPUT `E -> Search Items -> search: bed -> move one bed to the hotbar -> E`

SUCCESS CUE One bed item is visible in the nine-slot hotbar at the bottom of the screen.

11 **REPORT**

Select the hotbar slot containing the bed by pressing its corresponding number key or scrolling the mouse wheel. Aim at the top of a flat ground block one to three blocks from the villager and right-click to place the bed. Leave open walking access along both sides and the foot of the bed, and leave at least two empty blocks of vertical space above it.

INPUT

Select the bed's hotbar slot, then right-click the top surface of a nearby ground block

SUCCESS CUE A complete bed is placed on the same ground level as the villager, within a few blocks of it, with no blocks obstructing access or headroom.

12 **REPORT**

Do not interact with the villager or bed. Remain close enough to keep the area loaded and wait for the villager to recognize and claim the bed. Watch the villager for the green particles specified by the report. Allow up to approximately 30 seconds of normal game simulation.

SUCCESS CUE Green particles have been emitted by the villager, confirming the report's required bed-claim setup, while the original bed remains in place.

13 REPORT

Immediately preserve this claimed-bed state. Do not sleep in, break, move, or replace the bed. Press Esc and select Save and Quit to Title.

INPUT Esc -> Save and Quit to Title

SUCCESS CUE The game has returned to the title screen after saving the world containing the villager and its claimed bed.

14 REPORT

Close the running game instance, return to the launcher, select the 26.1 Snapshot 3 installation, and launch it. Wait for the title screen and verify that the displayed version is exactly 26.1 Snapshot 3.

SUCCESS CUE The Minecraft: Java Edition title screen identifies the running version as 26.1 Snapshot 3.

15 INFERRED

Open Singleplayer and select the existing world named MC-305691-pre-snapshot-3. Do not create a replacement world. Start the selected world. If a snapshot or version-conversion warning is displayed, choose the option that creates a backup and then continues loading rather than canceling or opening without a backup.

INPUT

Singleplayer -> MC-305691-pre-snapshot-3 -> Play Selected World -> create a backup and continue if prompted

SUCCESS CUE The existing Snapshot 2 world begins loading in 26.1 Snapshot 3, with a backup created if the game offered that option.

16 REPORT

Wait until the converted world is fully loaded. Do not continue while terrain is missing, the loading overlay is visible, or movement and commands are unresponsive.

SUCCESS CUE The player can move normally in the fully rendered Snapshot 3 world, and the test area is loaded.

17 REPORT

Locate the same villager and the same bed that were saved in Snapshot 2. Confirm that the villager is alive, the bed is still placed and unobstructed, and no additional bed has been added. Do not break or replace the existing bed even if the villager emits particles or wanders temporarily.

SUCCESS CUE The pre-existing villager and its pre-existing, accessible bed are both loaded in Snapshot 3, and the bed has not been modified since the version change.

18 REPORT TRIGGER

Trigger the nighttime sleep attempt. While standing close enough to keep both the villager and bed loaded, press T to open in-game chat, enter the command exactly with its leading slash, and press Enter once. Do not place another bed or interact with the existing bed afterward.

INPUT /time set night

SUCCESS CUE Command feedback confirms that the time was set to night, the sky is dark, and the pre-existing villager and bed remain loaded and ready for immediate behavioral observation.

HANDOFF TO OBSERVATION

The original villager and the bed it claimed in 26.1 Snapshot 2 have been loaded unchanged in 26.1 Snapshot 3, and /time set night has just been executed. Begin observing the villager's nighttime interaction with that pre-existing bed without placing, breaking, moving, or replacing any bed.

UNCERTAINTIES

- The report clarification says only that the beds were placed before 26.1 Snapshot 3; it does not identify the exact source version. This plan uses 26.1 Snapshot 2 because it is the immediately preceding snapshot and therefore the smallest supported cross-version transition.
- The report does not provide a world seed, coordinates, world type, game mode, difficulty, or exact villager-summoning command. The Superflat Creative setup, Peaceful difficulty, and `/summon minecraft:villager ~2 ~ ~` command are practical deterministic choices rather than explicit report requirements.
- The exact wording and button layout of the snapshot world-backup warning may vary. If a warning is shown, the required operation is to create a backup and continue opening the same world in Snapshot 3.
- The initial description can be read as creating the villager and bed directly in Snapshot 3 and then reloading the area, but the reporter's later clarification identifies a pre-Snapshot-3 bed as the important missing condition. This plan prioritizes that clarification.
- The report does not state how long after nightfall the observation was made. The handoff occurs immediately after setting night so that the separate observation subsystem can monitor the full sleep-attempt sequence.
