

Tridents or arrows shot through lava sometimes don't catch fire

MC-7697 PROJECTILES

Status	Resolved / Fixed
Affected	Minecraft 1.4.7; Minecraft 16w20a; Minecraft 1.10.2; Minecraft 16w32a; Minecraft 16w32b; Minecraft 16w33a; Minecraft 16w42a; Minecraft 1.12.2; Minecraft 18w10b; Minecraft 1.13.1; Minecraft 1.14.2; 20w19a; 1.16.3; 1.16.4; 20w48a; 20w49a; 20w51a; 21w03a; 1.16.5; 21w05a; 21w05b; 21w06a; 21w07a; 21w08b (+more)
Fixed in	25w02a
Reported	2013-01-17
Mojira category	Projectiles

REPRODUCTION TARGET

Use version: Minecraft 1.4.7

Affected versions (74):

- Minecraft 1.4.7
- Minecraft 16w20a
- Minecraft 1.10.2
- Minecraft 16w32a
- Minecraft 16w32b
- Minecraft 16w33a

- 1.21.3
- 1.21.4

Environment: Unmodified Minecraft Java Edition 1.4.7 in a single-player Creative-mode world, using mouse and keyboard controls. Use arrows and a bow for this version-specific reproduction path. No seed, coordinates, server, datapack, or special graphics setting is required by the report.

PRECONDITIONS

- A playable Minecraft Java Edition 1.4.7 installation is available.
- Use an unmodified client so that mods do not change projectile or fluid behavior.
- Create or use a Creative-mode world so the setup materials can be obtained deterministically.
- Have an open, approximately level area with at least 25 blocks of unobstructed horizontal space.
- Use the configured controls corresponding to Inventory (default E), Use Item (default right mouse button), Attack/Break (default left mouse button), and movement.
- The following items must be available from the Creative inventory: stone or another nonflammable full block, one block of diamond, one lava bucket, one bow, and at least one stack of arrows.

STEPS TO REPRODUCE

1 **REPORT**

Start Minecraft Java Edition using the affected release selected for this reproduction. Do not use the listed fix version 25w02a.

INPUT **Minecraft 1.4.7**

SUCCESS CUE The title screen identifies the running version as Minecraft 1.4.7.

2 **INFERRED**

From the title screen, create a single-player Creative-mode world: select Singleplayer, select Create New World, cycle the Game Mode option until it reads Creative, and create the world. No particular seed is required.

INPUT **Singleplayer -> Create New World -> Game Mode: Creative -> Create New World**

SUCCESS CUE The player spawns in a world and can fly and place or break blocks immediately.

3 **INFERRED**

Wait before building until the nearby terrain is rendered and movement responds normally.

SUCCESS CUE The ground and surrounding chunks are visible, and the player can move without waiting for terrain to appear.

4 **INFERRED**

Press the Inventory control, default E, to open the Creative inventory. Locate stone or another nonflammable full block, a block of diamond, a lava bucket, a bow, and arrows. Place the building block, diamond block, lava bucket, and bow into hotbar slots, and place at least one stack of arrows in the inventory or hotbar. Close the inventory with E or Esc.

INPUT

E; place stone, Block of Diamond, Lava Bucket, Bow, and at least 64 Arrows into the player inventory; E or Esc

SUCCESS CUE The hotbar contains the building blocks, diamond block, lava bucket, and bow, and the inventory contains arrows.

5 **INFERRED**

Move to an open, approximately level location with enough room for a lava column, a shooting marker about 10 blocks away, and a target wall on the opposite side.

INPUT **W/A/S/D; double-tap Space to begin Creative flight if needed**

SUCCESS CUE At least 25 blocks of clear horizontal space are available along one straight line.

6 **INFERRED**

Using the nonflammable building block, construct a 5-by-5-block horizontal basin floor at ground level. Place a one-block-high border on top of the outer edge of that floor, leaving a 3-by-3 interior. This basin is only intended to contain lava that reaches the bottom of the test column.

INPUT **Select the stone hotbar slot; right-click to place blocks**

SUCCESS CUE A 5-by-5 nonflammable floor with a one-block-high perimeter surrounds a 3-by-3 recessed interior.

7 **INFERRED**

Identify the exact center block of the 5-by-5 basin floor. Build a temporary vertical pillar five blocks high starting on top of that center block.

INPUT

Right-click five times while aiming at the top face of the center block and then each newly placed block

SUCCESS CUE A five-block-tall temporary pillar rises from the center of the basin.

8 **INFERRED**

At the height of the pillar's top block, place one nonflammable block directly adjacent to each of its four horizontal faces. These four blocks must surround the top block to the north, south, east, and west while leaving the diagonal corners open.

INPUT

Right-click to place four blocks, one against each horizontal side of the top pillar block

SUCCESS CUE The pillar's top block is surrounded horizontally by four nonflammable blocks.

9 **INFERRED**

Break all five blocks of the temporary center pillar using the Attack/Break control, default left-click. Do not break the four blocks surrounding its former top position.

INPUT Left-click each of the five temporary pillar blocks

SUCCESS CUE The center is an open vertical air column, with four floating blocks surrounding the top position on its horizontal sides.

10 **REPORT**

Choose one horizontal direction through the basin center as the shooting direction. On one side of the basin, count approximately 10 horizontal block positions from the basin center. Replace the ground block at that position with the diamond block. This is the required standing marker from the report.

INPUT

Select Block of Diamond; left-click the ground block at the marker position; right-click to place the diamond block

SUCCESS CUE A single diamond block marks a firing position approximately 10 blocks from the center of the future lava column.

11 **INFERRED**

On the side of the basin directly opposite the diamond block, construct a target wall from nonflammable blocks. Place it approximately five blocks beyond the basin center and make it at least three blocks wide and four blocks high. Center the wall on the straight line from the diamond block through the basin center.

INPUT

Select the nonflammable building block; right-click to construct a 3-block-wide by 4-block-high wall

SUCCESS CUE The diamond block, basin center, and middle column of the target wall lie on one straight horizontal line.

12 INFERRED

Fly to the four-block holder above the basin. Select the lava bucket and place one lava source in the central air position surrounded horizontally by the four holder blocks. Aim at an inward-facing side of a holder block so the lava is placed in the center rather than on top of the holder.

INPUT Select Lava Bucket; right-click an inward-facing holder-block face

SUCCESS CUE A single lava source occupies the center of the four holder blocks and a vertical lava stream begins descending into the basin.

13 INFERRED

Wait until the lava has descended to the basin and finished visibly updating. Confirm that the elevated portion forms a continuous vertical lava column between the diamond marker and target wall. Do not shoot through the spreading lava at basin-floor level; the intended line passes horizontally through the vertical column above the border.

SUCCESS CUE The lava column is continuous, the bottom flow is contained by the basin, and fluid movement has stabilized.

14 REPORT

Move onto the diamond block and stop approximately in its center. Face directly toward the lava column and target wall.

INPUT W/A/S/D; move the crosshair to face the lava and wall

SUCCESS CUE The player is standing on the diamond block with the lava column centered between the player and target wall.

15 INFERRED

Select the bow's hotbar slot. Verify that arrows remain in the inventory.

INPUT Press the number key corresponding to the Bow hotbar slot

SUCCESS CUE The bow is visible in the player's hand, and at least one arrow stack is available.

16 INFERRED

Without leaving the diamond block, align the crosshair with the center column of the target wall at approximately the player's eye height. Ensure that the straight sight line crosses the central portion of the vertical lava column rather than passing beside or above it.

INPUT

Move the mouse until the crosshair is centered on the target wall through the lava column

SUCCESS CUE The crosshair, center of the lava column, and center of the target wall are aligned.

17 REPORT

Hold the Use Item control, default right mouse button, until the bow reaches its fully drawn visual state. Keep the crosshair aligned and do not move off the diamond block.

INPUT Hold right-click until the bow is fully drawn

SUCCESS CUE The bow is visibly at full draw while the crosshair remains aimed through the lava at the target wall.

18 **REPORT** **TRIGGER**

Release the Use Item control to fire the first fully drawn arrow through the lava column toward the target wall. This is the first trigger action for the behavior under inspection.

INPUT Release right-click

SUCCESS CUE The first arrow has been launched on a path through the lava column toward the target wall.

19 **INFERRED**

Remain on the diamond block and repeat the same controlled full-draw shot nine additional times: realign through the center of the lava if necessary, hold the Use Item control until the bow is fully drawn, and release it. Do not intentionally vary the firing position or aim between shots. The report specifies multiple projectiles because the condition is intermittent; ten total shots provide a bounded test series.

INPUT

For each of 9 additional shots: hold right-click until full draw, then release right-click

SUCCESS CUE A total of 10 fully drawn arrows have been launched from the diamond block along the same line through the lava column.

HANDOFF TO OBSERVATION

The controlled firing series has begun at step 18 and, after step 19, a total of 10 full-draw arrows have just been fired from the diamond block through the same stabilized lava column toward the target wall. The observation subsystem should inspect each projectile during this firing series without changing the player's position, aim line, lava setup, or game version.

UNCERTAINTIES

- The attachment showing the original setup was named in the report but its image contents were not supplied. The plan therefore uses the report comment's textual alternative: one lava source, a firing position about 10 blocks away, and a fully drawn bow shot through the lava.
- The exact attachment geometry is unknown. The elevated source holder, containment basin, and target wall are practical construction choices intended to create a stable, clearly aligned lava crossing without changing the stated trigger action.
- The report does not specify a game mode. Creative mode is selected only to make setup and item acquisition deterministic.
- The report says to fire multiple projectiles but does not provide an exact count. This plan uses 10 total arrows as a bounded test series for the intermittent condition.
- The arrow branch is used because the report permits either tridents or arrows and the selected first affected version is Minecraft 1.4.7. No trident-specific procedure is required for this reproduction path.
- Comment 16 mentions confirmation in 24w45a, but that version is not present in the report's Affects versions field and has therefore not been added to affected_versions.
