Reported	2022-10-19
Mojira category	Mob spawning; Structures

REPRODUCTION TARGET

Version: Minecraft Java Edition 1.19.3
Environment: Vanilla Minecraft Java Edition 1.19.3 in a fresh single-player world using the integrated server. Use default Overworld generation with structures enabled, Creative mode, commands enabled, and the built-in Update 1.20 experimental data pack enabled. In 1.19.3, camels are available only when this experimental feature pack is enabled. ([minecraft.net](https://www.minecraft.net/en-us/article/minecraft-java-edition-1-19-3))

PRECONDITIONS

- Use a newly created world that has never generated the target coordinates; do not reuse a save in which the destination village has already been loaded.
- Use the exact seed -381051283335009767.
- Enable the built-in Update 1.20 experimental data pack during world creation; it cannot be enabled after the world has been created.
- Keep Generate Structures enabled and use the Default world type so the desert village generates.
- Enable commands. Creative mode is recommended as a practical way to provide command permission and safe movement, although the report does not specify a required game mode.
- Be prepared to inspect the destination immediately after teleporting because the camel is mobile and may move away from its initial village spawn location.

STEPS TO REPRODUCE

1 REPORT

In the Minecraft Launcher, create or select an installation that runs the exact release version Java Edition 1.19.3, then launch it. Do not use 1.20.1 or a current release because the deterministic example in the report is explicitly identified as 1.19.3.

INPUT 1.19.3

SUCCESS CUE The lower-left corner of the Minecraft title screen identifies the running version as Minecraft 1.19.3.

2 INFERRED

From the title screen, select Singleplayer, then select Create New World. Create a new save rather than opening or recreating a previously visited copy of the test world.

SUCCESS CUE The Create New World settings screen is open for a fresh world.

3 INFERRED

Set Game Mode to Creative and verify that Allow Cheats is ON. Creative mode is an execution convenience rather than a condition asserted by the report; the essential requirement is permission to run the supplied teleport command.

SUCCESS CUE The world-creation screen displays Game Mode: Creative and Allow Cheats: ON.

4 VERIFIED

Select Data Packs. In the Available list, locate the built-in pack named Update 1.20, hover over it, and click its right-facing activation arrow so it moves into the Selected list. Select Done. If Minecraft displays an experimental-settings warning, select Proceed. This pack must be enabled during world creation because camels are otherwise unavailable in Java Edition 1.19.3.

INPUT Update 1.20

SUCCESS CUE Update 1.20 is in the Selected data-pack list and the world-creation screen has accepted the experimental configuration.

5 REPORT

Open More World Options. Enter the report's seed exactly, including the leading minus sign. Leave World Type set to Default and verify Generate Structures is ON.

INPUT -381051283335009767

SUCCESS CUE The seed field contains -381051283335009767, World Type is Default, and Generate Structures is ON.

6 INFERRED

Select Create New World. If another experimental-world confirmation appears, select Proceed. Wait for world generation to finish without closing the game.

SUCCESS CUE The player has entered the newly generated world and the initial surrounding terrain has rendered.

7 INFERRED

Wait until the initial spawn area finishes loading and normal player input responds. Do not manually travel toward the target coordinates, because the supplied teleport command is the deterministic route to the village.

SUCCESS CUE The loading screen is gone, nearby terrain is rendered, and camera or movement input responds normally.

8 **INFERRED**

Press T, or the currently bound Open Chat control, to open in-game chat. Run the command in chat rather than in the launcher or a server console.

INPUT **T**

SUCCESS CUE The chat input field is visible at the bottom of the game screen.

9 **REPORT**

Enter the supplied command exactly as written. Include the leading slash. Do not round the coordinates or remove the yaw and pitch values at the end.

INPUT `/execute in minecraft:overworld run tp @s -446.99 72.00 2502.34 -23.39 6.11`

SUCCESS CUE The complete command is present in the chat input field, ending with -23.39 6.11.

10 **REPORT** **TRIGGER**

Press Enter once to execute the teleport command. This loads the destination containing the deterministic desert-village example; do not execute the command repeatedly.

INPUT **Enter**

SUCCESS CUE The player view changes to the destination at approximately X=-446.99, Y=72.00, Z=2502.34, with the command-provided facing direction applied.

11 **INFERRED**

Do not walk away after teleporting. Wait only until the destination terrain and village blocks have rendered and the game responds normally. Use mouse movement to scan the immediate view for the village camel while minimizing delay; do not strike, mount, lead, push, or otherwise interact with it.

SUCCESS CUE The destination desert-village area is rendered and a naturally generated camel can be visually inspected among the nearby village blocks.

12 **REPORT**

Center the camera on the camel and the blocks immediately surrounding its body. If necessary, make only a small camera adjustment or a minimal Creative-mode repositioning while keeping the camel in view. Stop before evaluating the camel's exact intersection with those blocks.

SUCCESS CUE The camel and its immediately adjacent village blocks are simultaneously visible at close enough range for the observation subsystem to inspect their spatial relationship.

HANDOFF TO OBSERVATION

The fresh 1.19.3 world has loaded the supplied coordinates for the first time, the destination desert village is rendered, and the camera is centered on the naturally generated camel and its adjacent blocks. Begin observation immediately without interacting with the camel.

UNCERTAINTIES

- The report does not specify a game mode. Creative mode is recommended only to ensure command access and safe repositioning; it is not asserted as a reproduction requirement.
- The primary seed and exact teleport command are explicitly associated with version 1.19.3. Other affected versions are listed, but terrain, village placement, experimental-feature menus, or required data packs may differ in those versions.
- The report does not identify the target village component by name. The supplied position and facing direction should place the player near the relevant camel and surrounding village blocks.
- Because the camel can move after village generation, a delayed inspection may miss its initial placement. If the camel is absent from the immediate village area, discard that save and repeat from a newly created world with the same seed rather than revisiting already-generated chunks.
- The report attachments that may visually identify the exact block arrangement were not supplied as viewable image content.
