

The server console or LAN game output spammed with "PLAYER moved too quickly!" after a player dies and respawns

[MC-276638](#) DEBUG

Status	Resolved / Fixed
Affected	24w37a; 24w38a
Fixed in	24w39a
Reported	2024-09-12
Mojira category	Debug; Performance; Player

REPRODUCTION TARGET

Use version:

24w37a

Affected versions (2):

24w37a

24w38a

Environment:

Minecraft Java Edition using the official vanilla 24w37a dedicated server and a client running the matching 24w37a installation. Keep the dedicated server console visible and continuously capturing output. Use one test player with operator permission; do not use a LAN-hosted single-player world, mods, plugins, or the teleport command for this reproduction.

PRECONDITIONS

- The official vanilla Minecraft Java Edition 24w37a dedicated server files are installed, the EULA has been accepted, and the server can start normally.
- A Minecraft Java Edition client installation for exactly 24w37a is available.
- The server world is not Hardcore, so the player can respawn after death.
- Only one test player should be connected, ensuring that the report-supplied @p selector targets that player deterministically.
- The test player has operator permission so the report-supplied /kill command can be executed from in-game chat.
- The dedicated server console is visible or its live output is otherwise being captured before the player is killed.
- The player must not use a bed, respawn anchor, /spawnpoint, or another mechanism to change the respawn point after its location has been recorded.

STEPS TO REPRODUCE

1 INFERRED

Start the official vanilla 24w37a dedicated server using its normal launch procedure, with the server console kept visible.

SUCCESS CUE The server console reports that startup is complete and the server is ready to accept player connections.

2 INFERRED

If the test player is not already an operator, enter the operator command directly in the dedicated server console. Replace the placeholder with the exact Minecraft profile name of the test player. Do not include a leading slash in the server console.

INPUT `op <test_player_name>`

SUCCESS CUE The server console confirms that the test player was made a server operator.

3 REPORT

Launch Minecraft Java Edition 24w37a on the client, open Multiplayer, connect to the dedicated server, and wait for the world to finish loading.

SUCCESS CUE The test player is standing in the server world, nearby terrain is rendered, movement responds normally, and no other players are connected.

4 INFERRED

At the player's initial respawn location, press the debug-screen control, F3 by default, and record the displayed X and Z coordinates. Treat this location as the respawn point for measuring the required travel distance. Do not sleep in a bed or otherwise change the respawn point.

INPUT `F3`

SUCCESS CUE The respawn point's X and Z coordinates have been recorded while the player remains near that point.

5 REPORT

Close the debug screen if desired, face a safe horizontal direction, and move away from the recorded respawn point by normal walking or sprinting. Use W to move forward and optionally hold the Sprint action, Left Ctrl by default. Do not use /teleport, /tp, or any other teleportation method.

INPUT `W; optionally hold Left Ctrl`

SUCCESS CUE The player has physically traveled away from the respawn point without using a teleport command.

6 INFERRED

Use the F3 debug coordinates to continue traveling until the player's X or Z coordinate is at least 48 blocks from the corresponding recorded coordinate, representing three full chunk widths in one horizontal direction.

INPUT `F3`

SUCCESS CUE The player is at least three chunk widths, 48 horizontal blocks, away from the recorded respawn point along X or Z.

7 INFERRED

Stop moving and wait until the surrounding terrain has rendered and normal movement and server interaction are responsive. Leave the dedicated server console visible or continuously captured.

SUCCESS CUE The destination area is loaded, the player is stationary and responsive, and the server console is ready to capture output from the next actions.

8 **INFERRED**

Press T, or the currently bound Open Chat control, to open in-game chat.

INPUT **T**

SUCCESS CUE The in-game chat input field is open and ready to accept a command.

9 **REPORT**

Enter the report-supplied command exactly as shown, including the leading slash, and press Enter once. Execute it from the test player's in-game chat rather than from the server console.

INPUT **/kill @p**

SUCCESS CUE The command kills the test player and the death screen appears with a Respawn button.

10 **REPORT** **TRIGGER**

Click the Respawn button once and immediately hand control to the observation subsystem while the dedicated server console continues to be captured.

INPUT **Left-click "Respawn"**

SUCCESS CUE The Respawn button has been activated and the client has begun leaving the death screen or loading the player back at the respawn point.

HANDOFF TO OBSERVATION

The player has just clicked Respawn after being killed at least three chunk widths from the recorded respawn point, and the dedicated vanilla server console is actively visible or being captured. Begin observing the console output immediately while the respawn completes.

UNCERTAINTIES

- The report does not provide a world seed, coordinates, game mode, difficulty, operating system, or server.properties configuration; no special values are introduced for them beyond requiring a non-Hardcore world.
- The report says to move "3 chunks away" but does not define whether this means chunk-index separation or a precise coordinate distance. The plan conservatively uses at least 48 blocks along X or Z, equal to three full 16-block chunk widths.
- The title also mentions LAN game output, but the formal reproduction steps specifically require the official vanilla dedicated server. This plan therefore uses the dedicated-server path and does not substitute a LAN world.
- The report does not state how many players were online. Restricting the test to one connected player is a practical choice that makes the supplied @p selector unambiguous without changing the command.
