

Command success messages for some commands include unaffected entities, unlike the command result

MC-122717 Commands

Status	Resolved / Fixed
Affected	Minecraft 17w48a, Minecraft 17w49a, Minecraft 17w49b, Minecraft 17w50a, Minecraft 18w01a, Minecraft 18w06a (+27 more)
Fixed in	26.3 Snapshot 1
Reported	2017-11-29

STEPS TO REPRODUCE

1. Launch Minecraft and open a Creative world with default settings.
2. Use a world in which at least six entities are present near the command executor.
3. Run `/tag @e[sort=nearest,limit=5] add test``.
4. Run `/tag @e[sort=nearest,limit=6] add test``.
5. Observe that the first command reports that the tag was added to 5 entities, while the second command reports that the tag was added to 6 entities even though only one additional entity was affected.

OBSERVED BEHAVIOUR

Actual behavior

When a command targets multiple entities, the command result correctly reports the number of entities that were successfully affected, but the success feedback uses the total number of entities matched by the selector.

For example:

```
```mcfunction
```

```
/tag @e[sort=nearest,limit=5] add test
```

```
```
```

affects five entities and reports:

```
```text
```

Added tag 'test' to 5 entities

```
```
```

Running:

```
```mcfunction
```

```
/tag @e[sort=nearest,limit=6] add test
```

```
```
```

matches six entities, but only the sixth entity is affected because the other five already have the ``test`` tag. The command result is therefore ``1``, while the feedback incorrectly reports:

```
```text
```

Added tag 'test' to 6 entities

```
```
```

The same discrepancy occurs when any subset of the selected entities is unaffected. If a selector matches multiple entities but only one of them is successfully affected, the command still uses the plural success message and the total selector count instead of reporting the single affected entity. This behavior also occurs for the other affected commands listed above, including ``/tag``, ``/scoreboard players enable``, ``/recipe``, ``/playsound``, ``/enchant``, ``/effect``, ``/clear``, and ``/advancement``.

EXPECTED BEHAVIOUR

The command feedback should report only entities that were actually affected. The first command should state that the tag was added to 5 entities, while the second should identify the single entity that received the tag rather than

claiming it was added to all 6 selected entities. Success messages should consistently match the command result and exclude entities that already had the tag.

ENVIRONMENT

Minecraft Java Edition Versions: 17w48a, 17w49a, 17w49b, 17w50a, 18w01a, 18w06a, 18w08b, 18w11a, 18w16a, 18w19b, 1.13-pre1, 1.13-pre2, 1.13-pre5, 1.13-pre9, 1.13, 18w30a, 18w44a, 19w02a, 19w08a, 19w11b, 1.14.3, 1.14.4, 19w40a, 19w46b, 20w07a, 20w17a, 1.18.2, 1.19.2, 22w42a, 1.20.6, 24w18a, 24w40a, 1.21.5 (includes snapshots)

ORIGINAL DESCRIPTION

The bug

When a command affects multiple entities, it's often the case that the command fails for some entities and succeeds for others. For example, adding a tag to some entities that already have it and others that don't. The command result usually reflects how many entities were successfully affected, but the command feedback message often includes all entities, even unaffected ones.

Affected commands

Each of these commands behaves similarly:

- result is the number of affected entities.
- If none were affected, an error is shown.
- If any were affected, the success message includes the total number of entities found by the selector, not just the affected ones.
- The "single success" message only appears if the selector only found one entity; it does not appear when it found multiple but only one was affected.

Command

An entity is unaffected if...

/tag ... add

It has too many tags, or already has the tag

/tag ... remove

It doesn't have the tag

/scoreboard players enable

The trigger is already enabled for that player

/recipe give

The player already knows the recipe

/recipe take

The player doesn't know the recipe

/playsound

The player is "too far away"

/enchant

It's not a mob/player

It's not holding anything

It's holding an incompatible item

It's holding an item with incompatible enchantments

/effect give

It's not a mob/player

It's immune to the effect

It has a stronger effect already

/effect clear ...

It's not a mob/player

It doesn't have the effect

/effect clear

It's not a mob/player

It doesn't have any effects

/clear ...

No matching items were found

/advancement grant

The player already has the advancement

/advancement revoke

The player doesn't have the advancement

/advancement grant ... only ...

The player already has the criterion

/advancement revoke ... only ...

The player doesn't have the criterion

/advancement poses a unique challenge. The result is simply the number of changes applied to any player, meaning the many-to-many scenario currently does not know (A) how many advancements found were changed on at least one player, and (B) how many players found had at least one advancement changed. Those
