

Smelting recipes do not add the correct count of items to the output

MC - 305693 Crafting

Status	Resolved / Fixed
Affected	26.1 Snapshot 3
Fixed in	26.1 Snapshot 5
Reported	2026-01-13

STEPS TO REPRODUCE

1. Launch Minecraft.
2. Create a new Creative world with default settings.
3. Add the attached datapack to the world.
4. Open a furnace with an empty output slot.
5. Place a stack of cactus in the furnace.
6. Place fuel in the furnace.
7. Wait until the first cactus is smelted.
8. Observe that the furnace output contains 4 green dye.
9. Wait until the second cactus is smelted.
10. Observe that the furnace output contains 5 green dye instead of 8.

OBSERVED BEHAVIOUR

When the furnace output slot is empty, the first smelting operation applies the recipe's result count correctly. With the provided recipe, smelting one cactus initially produces a stack of **4 green dye**.

For subsequent smelting operations, the furnace adds only **1 green dye** to the existing output stack, instead of the recipe-defined count of 4. As a result, after smelting a second cactus, the output contains **5 green dye** rather than **8**. Each additional smelting operation continues to increase the output by only 1 item, despite the recipe specifying `"count": 4`.

EXPECTED BEHAVIOUR

When a smelting recipe produces multiple items, each completed smelt should add the full result count to the furnace output stack. For a recipe that produces four green dye per cactus, the first smelt should create a stack of four dye, and each subsequent smelt should increase the stack by four more items, resulting in eight after the second smelt rather than adding only one.

ENVIRONMENT

Minecraft Java Edition Version 26.1 Snapshot 3 (snapshot)

ORIGINAL DESCRIPTION

Expected Behavior

A smelting recipe with a count greater than 1 in the result field should add that many items to the output item stack when smelting finishes.

Observed Behavior

When the output stack is empty, the correct number of items is added to the output stack. (i.e. if the count for a smelting recipe is set to 4, and the furnace output is empty, the initial item stack will have 4 items in it.

After the first item is smelted, future smelting only adds 1 item to the output stack, regardless of the count.

Steps to Reproduce

- Add the attached datapack to a world.
- Place a stack of cactus in the furnace.
- Place fuel in the furnace.
- After the first item is smelted, there will be 4 dye in the output slot:

- After the second item is smelted, there will be 5 dye int the output slot.

The attached datapack adds a single recipe that causes a single cactus to produce 4 green_dye instead of 1. The recipe's cookingtime has been decreased to make observing the bug faster:

data/minecraft/recipe/green_dye.json :

```
{
