

set_enchantments function removes enchantments component from books

MC-276433 Loot tables

Status	Resolved / Fixed
Affected	1.21.1, 24w36a
Fixed in	24w37a
Reported	2024-09-06

STEPS TO REPRODUCE

1. Create or open a world with the attached data pack `MC-276433.zip` applied.
2. Run `/loot give @s loot test:test`.
3. Hold the enchanted book obtained from the loot command.
4. Run `/data get entity @s SelectedItem.components."!minecraft:enchantments"`.
5. Observe that the command outputs `` has the following entity data: `{}` instead of reporting that no elements match the specified component.

OBSERVED BEHAVIOUR

The `set\_enchantments` function removes the `minecraft:enchantments` component when it processes an enchanted book whose item ID is `minecraft:book`. With the attached data pack, running `/loot give @s loot test:test` and then checking `SelectedItem.components."!minecraft:enchantments"` returns `{}`, indicating that the component is present instead of absent. The same issue occurs in vanilla when a Wind Burst enchanted book obtained from an ominous vault in a trial chamber is disenchanting using a grindstone. The resulting book has eight components instead of the nine components present on a normal book, cannot be enchanted in an enchanting table, and does not stack with normal books because its `minecraft:enchantments` component has been removed. This behavior does not occur with other enchanted item types or when the item ID is `minecraft:enchanted\_book` rather than `minecraft:book`.

EXPECTED BEHAVIOUR

The `set\_enchantments` function should preserve the book's enchantments component, so querying for its absence should find no matching elements rather than return an empty component. After an enchanted book is disenchanting, it should remain a normal book that stacks with other books and can be enchanted again in an enchanting table, without losing compatibility because of its origin.

ENVIRONMENT

Minecraft Java Edition Versions: 1.21.1, 24w36a (includes snapshots)

ORIGINAL DESCRIPTION

Steps to reproduce:

- Create/open a world with the attached data pack applied: MC-276433.zip
- Run `/loot give @s loot test:test`
- While holding the enchanted book, run `/data get entity @s SelectedItem.components."!minecraft:enchantments"`

Observed result:

The command outputs:

<username> has the following entity data: {}

Expected result:

The command outputs:

Found no elements matching SelectedItem.components."!minecraft:enchantments"

Steps to reproduce (vanilla):

- Go to a trial chamber

- Open ominous vaults until you get an enchanted book. Keep opening ominous vaults until you get a wind burst enchanted book.
- Disenchant the book you just obtained from the ominous vault using a grindstone
- Try to enchant the book you just disenchant in an enchantment table
- Try to stack the book with other normal books

Observed result:

The book that was obtained and disenchant from the trial chambers will not stack with other books and cannot be enchanted. After checking with advanced tooltips, this book only has 8 components, compared to normal book items with 9 components. After examining this glitched item in an nbt editor, the book had a minecraft:enchantments component removed. This is what was causing the book to not stack with other normal book items and not be enchantable by normal means.

Expected result:

The book that was obtained and disenchant from the trial chambers should stack with other books and should be enchanted.

Notes:

This does not happen with other enchanted items, nor does it happen when name is set to minecraft:enchanted_book instead of minecraft:book.
