

Minecarts can phase through blocks at the bottom of a slant

MC-275276 Minecart

Status	Resolved / Fixed
Affected	1.21.1, 24w33a
Fixed in	24w34a
Reported	2024-08-15

STEPS TO REPRODUCE

1. Create or load a Minecraft world.
2. Build the reported setup with a sloped rail section, a block at the bottom of the slope, and rails to the left of the bottom section.
3. Place a minecart at the top of the slope.
4. Push the minecart down the slope.
5. Observe that the minecart can phase through the block at the bottom of the slope and may move onto the rails to the left; repeat with the other rail types to reproduce the issue with each type.

OBSERVED BEHAVIOUR

The minecart can pass through the solid block at the bottom of the sloped rail section instead of being stopped or remaining on the intended track. At higher speeds, it is more likely to emerge onto the rails on the left side of the setup. This behavior occurs regardless of the rail type used.

EXPECTED BEHAVIOUR

The minecart should travel down the sloped rails and remain properly aligned with the track as it reaches the bottom. It should collide with and stop at the block rather than phasing through it, regardless of the rail type or its speed. Increasing the minecart's velocity should not make it more likely to leave the intended track or move onto the rails to the left.

ENVIRONMENT

Minecraft Java Edition Versions: 1.21.1, 24w33a (includes snapshots)

ORIGINAL DESCRIPTION

Steps to reproduce:

- Build the following setup:
- Push the minecart down the slope

Observed result:

Expected result:

The minecart would not phase through the block at the bottom of the slope.

It occurs with all types of rails, and the faster it goes, the more likely it is to go onto the rails to the left.
