

Zombie villagers saved in jigsaw structures forget their biome variant and profession upon world generation

MC-299782 [Save Data](#)

Status	Resolved / Fixed
Affected	1.21.7, 1.21.8 Release Candidate 1, 1.21.8
Fixed in	25w31a
Reported	2025-07-16

STEPS TO REPRODUCE

1. Launch Minecraft 1.21.7.
2. Create a world using the attached datapack, which contains the ``zombievillagertest:librarian`` structure.
3. Allow the datapack's jigsaw structure to generate into the world.
4. Observe the zombie villagers generated across the surface, including their professions, biome variants, and levels.
5. Run ``/place structure zombievillagertest:librarian``.
6. Observe the zombie villager produced by the command.
7. Run ``/place template zombievillagertest:librarian``.
8. Observe the zombie villager produced by the command.
9. Place a structure block and load the structure ``zombievillagertest:librarian``.
10. Observe that the zombie villagers generated by the jigsaw structure and ``/place structure`` have random professions and biome variants, while those generated by ``/place template`` and the structure block retain the librarian profession, jungle variant, and level 2.

OBSERVED BEHAVIOUR

When the structure is assembled through jigsaw-based world generation, the zombie villager does not retain its saved profession or biome variant. It generates with a randomly selected profession and a biome variant based on the biome where the structure is placed. The villager's level remains level 2.

The same loss of profession and biome variant occurs when using:

- ``/place structure zombievillagertest:librarian``
- Jigsaw-based generation from the datapack

In contrast, both ``/place template zombievillagertest:librarian`` and loading the structure with a structure block preserve the zombie villager's saved librarian profession and jungle biome variant.

EXPECTED BEHAVIOUR

Zombie villagers generated from the saved jigsaw structure should consistently retain the properties stored in the structure: librarian profession, jungle biome variant, and level 2. This should occur when the structure generates naturally in the world, through ``/place structure``, through ``/place template``, and when loaded with a structure block, regardless of the biome where the structure is placed.

ENVIRONMENT

Minecraft Java Edition Versions: 1.21.7, 1.21.8 Release Candidate 1, 1.21.8

ORIGINAL DESCRIPTION

Previously, Zombie villagers with a specific profession and biome variant that were saved to a structure jigsaw piece would retain this data upon generated in a world. However, as of 1.21.6 onward (only discovered in 1.21.7), these details are not saved, resulting in the zombie villager generating with a random profession and biome variant. This bug also seems to occur with the `/place structure` command but not as `/place template`.

Steps to Reproduce:

- Download the attached datapack. It contains a structure that simply contains a zombie librarian villager that's jungle variant and level 2.
- Generate into a world with the datapack and note the many zombie villagers across the surface. Note their professions and biome variant.
- Generate one with the `/place structure` command and observe the zombie villager produced from it. Example command: `/place structure zombievillagertest:librarian`
- Generate one with the `/place template` command and observe the zombie villager produced from it. Example command: `/place template zombievillagertest:librarian`
- Place a structure block down and load in the structure "zombievillagertest:librarian". Observe the profession and biome variant.

Expected Result:

- All the zombie villagers generated will be librarian, jungle, and level 2.

Actual Result:

- The zombie villagers generated with the `/place template` command and via loading from a structure block are the only ones to maintain their profession and variant. Every other method resulted in random professions and biome relevant to the biome it generated in. It will however maintain the level of the villager consistently with all methods listed.
