

Giant Spruce Taiga Hills has no difference with Giant Spruce Taiga

MC-140690 World generation

Status	Resolved / Fixed
Affected	Minecraft 1.13.2, Minecraft 18w48a, Minecraft 18w48b, Minecraft 18w49a, Minecraft 18w50a, Minecraft 19w02a (+154 more)
Fixed in	21w37a
Reported	2018-12-06

STEPS TO REPRODUCE

1. Launch Minecraft 18w49a.
2. Create a buffet world using the Giant Spruce Taiga biome.
3. Inspect the terrain generated in the world.
4. Create a second buffet world using the Giant Spruce Taiga Hills biome.
5. Inspect the terrain generated in the second world.
6. Observe that the Giant Spruce Taiga Hills terrain has no noticeable relief difference from the Giant Spruce Taiga terrain and is not hillier.

OBSERVED BEHAVIOUR

Actual behavior

The **Giant Spruce Taiga Hills** biome generates with the same terrain relief as the regular **Giant Spruce Taiga** biome. In practice, the Hills variant does not produce noticeably steeper or more elevated terrain; the two biomes differ only by their biome identifiers and name.

This can be observed by:

- Creating separate Buffet worlds using **Giant Spruce Taiga** and **Giant Spruce Taiga Hills**.
- Creating a world with seed `3743090988927099363` and visiting approximately `X=0, Z=-2180`. A river separates a Giant Spruce Taiga Hills biome to the north from a Giant Spruce Taiga biome to the south, but both sides generate with equivalent terrain relief.

In the affected versions, both biome definitions use the same terrain parameters:

```
```java
setBaseHeight(0.2F)
setHeightVariation(0.2F)
```
```

Consequently, the biome intended to be the hillier variant does not have increased terrain height or variation. This differs from **Giant Tree Taiga** and **Giant Tree Taiga Hills**, whose biome definitions use different height parameters and therefore generate visibly different relief.

EXPECTED BEHAVIOUR

Giant Spruce Taiga Hills should generate noticeably more elevated and varied terrain than the regular Giant Spruce Taiga biome, reflecting its intended hilly variant. When the two biomes border each other, the Hills biome should have distinct, hillier relief rather than identical terrain, while the standard Giant Spruce Taiga should retain its comparatively flatter generation.

ENVIRONMENT

Minecraft Java Edition Versions: 1.13.2, 18w48a, 18w48b, 18w49a, 18w50a, 19w02a, 19w03a, 19w03b, 19w03c, 19w04a, 19w04b, 19w05a, 19w06a, 19w07a, 19w08a, 19w08b, 19w09a, 19w11a, 19w11b, 19w12a, 19w12b, 19w13a, 19w13b, 19w14a, 19w14b, 1.14 Pre-Release 1, 1.14 Pre-Release 2, 1.14 Pre-Release 3, 1.14 Pre-Release 4, 1.14 Pre-Release 5, 1.14, 1.14.1 Pre-Release 1, 1.14.1 Pre-Release 2, 1.14.1, 1.14.2 Pre-Release 1, 1.14.2 Pre-Release 2, 1.14.2 Pre-Release 3, 1.14.2 Pre-Release 4, 1.14.2, 1.14.3 Pre-Release 1, 1.14.3 Pre-Release 2, 1.14.3 Pre-Release 3, 1.14.3 Pre-Release 4, 1.14.3, 1.14.4 Pre-Release 1, 1.14.4 Pre-Release 2,

ORIGINAL DESCRIPTION

The bug :

There is no difference between Giant Spruce Taiga Biome and Giant Spruce Taiga Hills Biome. The supposed hillier version is not. The problem is that the game isn't using correct values of `setBaseHeight` and `setHeightVariation` when generating the Giant Spruce Taiga Hills (Giant Spruce Taiga and Giant Spruce Taiga Hills are using the same values).

This bug exists since these biomes were added in the game, in 1.7.2.

It is not a feature suggestion, because it is clearly not intended. These biomes are coded exactly identical, only their name changes. Don't tell me that developers intentionally added a "Hills" variant which is generating exactly like the non-Hill variant.

How to reproduce :

-Create a buffet world for each biome, and see that there is no difference between the two variants.

-Or create a new world with the seed : 3743090988927099363

Go at coordinates 0 ~ -2180. There is a river, with a Giant Spruce Taiga Hills on the north side and a Giant Spruce Taiga on the south side. You can see that there is no terrain's difference between them, Giant Spruce Taiga Hills isn't hillier.

Giant Spruce Taiga :

Giant Spruce Taiga Hills :

Relief difference : 0

If you're thinking it is a feature suggestion, see the code. There is differences between Giant Tree Taiga and Giant Tree Taiga Hills for example, but no difference at all between Giant Spruce Taiga and Giant Spruce Taiga Hills.

Source code of Giant Spruce Taiga and Giant Spruce Taiga Hills :

Comparison with source code of Giant Tree Taiga and Giant Tree Taiga Hills, which work as intended :

Exact location of the code + all the source code of these 2 biomes :

Location of Biome list :

.minecraft\versions\18w49a\18w49a.jar\bbv.class

We can see on this screenshot that "giant_spruce_taiga" is using the bcv.class file, and that "giant_spruce_taiga_hills" is using the bcw.class file.

We will compare them to "giant_tree_taiga" and "giant_tree_taiga_hills" after, which use respectively bcx.class file and bcy.class file.

Location of Giant Spruce Taiga Biome code :

.minecraft\versions\18w49a\18w49a.jar\bcv.class
