Environment: Unmodified Minecraft Java Edition 1.4.7 client in a single-player world. Use Creative mode as a practical way to obtain the furnace and test items without introducing crafting or resource-gathering delays. Default controls are assumed: E opens the inventory, Esc opens the pause menu or closes an interface, and right-click performs Use Item/Place Block.

PRECONDITIONS

- Configure the Minecraft Launcher to start the exact affected release Minecraft 1.4.7; do not use the fix version 1.21.4 Pre-Release 2.
- Use a disposable single-player world because the procedure requires saving, quitting, and reopening the same save.
- Use a vanilla client without mods that alter furnaces, inventories, smelting, or furnace interfaces.
- No particular world seed, biome, coordinates, difficulty, or server configuration is specified by the report.
- The deterministic item choice for this plan is at least 8 Iron Ore as the smelting input, at least 2 Coal as the original long-burning fuel, and at least 1 Stick as the shorter replacement fuel.
- Keep the furnace near the player's initial location so the same furnace can be found immediately after the world reload.

STEPS TO REPRODUCE

1 **REPORT**

Start the game using the launcher installation for the exact recommended affected version, Minecraft 1.4.7. Wait for the main menu to finish loading.

INPUT `Minecraft 1.4.7`

SUCCESS CUE The Minecraft 1.4.7 main menu is displayed and accepts input.

2 **INFERRED**

Create a new single-player world in Creative mode, or open an existing disposable Creative-mode world. For a new world, choose Singleplayer, create a world, set the game mode to Creative, and enter the world.

INPUT `Singleplayer -> Create New World -> Game Mode: Creative -> Create New World`

SUCCESS CUE The player is in a responsive single-player world and can access the Creative inventory.

3 **INFERRED**

Open the Creative inventory with the inventory control, whose default key is E. Obtain and place in the player inventory or hotbar one Furnace, at least eight Iron Ore, at least two Coal, and at least one Stick. Close the inventory when finished.

INPUT `E; obtain Furnace x1, Iron Ore x8 or more, Coal x2 or more, and Stick x1 or more`

SUCCESS CUE The player inventory contains a furnace, multiple pieces of iron ore, at least two coal, and at least one stick.

4 **INFERRED**

Select the furnace in the hotbar. Stand near the world's initial player location, aim at the top or side of a solid ground block, and use the Place Block control, whose default input is right-click, to place the furnace.

INPUT `Select Furnace; right-click a solid block face`

SUCCESS CUE One furnace block is placed nearby and can be reached without exploration after reloading the world.

5 **INFERRED**

Aim at the placed furnace and use the Use Item control, whose default input is right-click, to open its interface.

INPUT `right-click the placed furnace`

SUCCESS CUE The furnace interface is open, showing an upper input slot, a lower fuel slot, and an output slot.

6 **INFERRED**

Move at least eight Iron Ore from the player inventory into the furnace's upper input slot. Use enough input items that the furnace can continue smelting while the following actions are performed.

INPUT `Iron Ore x8 or more -> upper furnace input slot`

SUCCESS CUE The upper input slot contains iron ore and the fuel slot is still available.

7 **INFERRED**

Move a stack containing at least two Coal into the lower fuel slot. One coal should be consumed to start the active burn while at least one additional coal remains visible in the fuel slot.

INPUT Coal x2 or more -> lower furnace fuel slot

SUCCESS CUE The furnace is actively burning: the flame symbol is lit, smelting progress has started, and at least one unconsumed coal remains in the lower fuel slot.

8 **REPORT**

Keep the furnace interface open and allow the active coal's burn time to decrease. Continue only after the flame-shaped burn-time indicator has visibly shortened from its initial full height while remaining lit. Do not wait for the active coal to finish burning.

SUCCESS CUE The flame indicator is still lit but is visibly lower than when the coal was first consumed, and iron ore remains available to smelt.

9 **REPORT**

Remove all unconsumed coal from the lower fuel slot without disturbing the iron ore. With the cursor empty, left-click the coal in the fuel slot to pick it up, then left-click an empty player-inventory slot to store it.

INPUT left-click remaining Coal in fuel slot; left-click an empty player-inventory slot

SUCCESS CUE The lower fuel slot is empty, the unused coal has been moved into the player inventory, and the furnace remains in the middle of the burn started by the already-consumed coal.

10 **REPORT**

Replace the removed coal with the shorter-burning fuel. Pick up at least one Stick from the player inventory with left-click, then left-click the empty lower fuel slot to place the stick there.

INPUT left-click Stick; left-click lower furnace fuel slot

SUCCESS CUE The lower fuel slot contains a stick while the furnace's already-active coal burn is still in progress.

11 **INFERRED**

Immediately close the furnace interface using Esc. Do not remain in the world long enough for the current active burn to expire.

INPUT Esc

SUCCESS CUE The world view is visible again, and the same furnace remains nearby.

12 **REPORT**

Open the pause menu with Esc and select Save and Quit to Title. This must be done while the furnace is still using the remaining burn time from the consumed coal and a stick is stored in its fuel slot.

INPUT Esc -> Save and Quit to Title

SUCCESS CUE The main menu is displayed, confirming that the single-player world was saved and closed.

13 **REPORT**

Choose Singleplayer, select the exact same saved world, and load it again. Do not create a replacement world.

INPUT Singleplayer -> select the same world -> Play Selected World

SUCCESS CUE The player has re-entered the same save containing the prepared furnace.

14 **INFERRED**

Wait until the local terrain and the furnace have rendered and player movement responds normally. Locate the nearby furnace placed before quitting.

SUCCESS CUE The prepared furnace is visible, the surrounding chunk is loaded, and normal movement and interaction are responsive.

15 **REPORT** **TRIGGER**

Aim at the same furnace and right-click it once to open its interface. Do not remove, insert, or rearrange any items after opening it; hand control to the observation subsystem immediately.

INPUT right-click the prepared furnace

SUCCESS CUE The reloaded furnace interface is open with its saved inventory available for inspection, and no post-reload item interaction has occurred.

HANDOFF TO OBSERVATION

The same prepared furnace has just been opened after saving, quitting, and reloading the world. The furnace interface is visible, and the player has not changed any furnace contents since reopening it. Begin observation of the burn-time indicator now.

UNCERTAINTIES

- The report does not specify a game mode. Creative mode is selected only as a practical, deterministic method of obtaining the required materials; it is not asserted to be a required bug condition.
- The report does not specify a smelting input or an exact long-fuel/short-fuel pair. Iron Ore, Coal, and Stick are chosen as a deterministic implementation of its requirements: start with a non-stick fuel, then replace the unconsumed fuel-slot contents with a shorter-burning fuel.
- The report gives no exact duration for allowing the first burn to decrease. This plan therefore uses the report's observable condition—the flame indicator must visibly shorten while remaining active—instead of imposing an unsupported fixed delay.
- A comment says that unloading and reloading the furnace's chunk can also trigger the issue without manually swapping fuel. This plan deliberately follows the primary description's Save and Quit procedure and explicit fuel swap rather than substituting the alternate chunk-unloading reproduction.
- No seed or coordinates are supplied. Placing the furnace close to the initial player location is an execution convenience, not a reported requirement.
